LIONWASH

Team: Hailey Shi, Jade Chen
Role: UI/UX Designer

Timeline: 2 week design sprint
Deliverables: Hi-Fi prototype

A Quick Overview

Challenge: Doing laundry is time-consuming and irritating for busy college students because it's hard to know when machines are available, but easy to forget about finished laundry.

Solution: LionWash tracks real-time machine progress and helps remind students to pick up their laundry with an in-app timer.

Process: We conducted 10 interviews with students living on campus and researched a website with similar functions to better understand how to improve the laundry experience.

Outcome: Within 2 weeks, we designed a high-fidelity app prototype with 3 key features to meet the needs of our intended users. After more iterations and user testing in the future, LionWash can be accessible to every Columbia student.

The Challenge

As Columbia students living on campus, we noticed that the current laundry system isn't well designed to adequately address problems that may arise from a student's perspective.

When finished laundry is neglected, other students will either:

1. continue waiting for another available machine, or
2. replace the clean load with their unwashed load without waiting for the previous user to retrieve it

This cycle wastes time and becomes an inconvenience for others, so how might we **improve** and **expedite** the laundry process to ensure an **efficient** and **unburdensome** experience for busy college students?

The Solution

Laundry should be a simple, hassle-free process. In order to provide such an experience for all residents, we've created LionWash, a mobile app that allows students to easily check for available machines and track their laundry progress.

Features include:

1. **Real-time tracking** of available washers and dryers
2. **In-app timer** to monitor the progress of laundry cycle
3. **Flag button** to report broken machines

Creating Personas

In order to better understand our Columbia peers, we interviewed 10 students living on campus. The personas below reflect their shared needs and frustrations that LionWash aims to improve.

Austin, Freshman

Laundry System Rating: ★★☆☆☆

“I was incredibly busy one night and forgot to set my timer. By the time I finished work and remembered to check on my laundry, I found all my wet clothes piled up on a table.”

Needs:

- Consistent reminders to help with busy schedules and multi-tasking
- Simple solution to save time and avoid unpleasant laundry scenarios

Sharon, Junior

Laundry System Rating: ★★★☆☆

“While juggling school with soccer practice and a research position, I become that much more frustrated when I haul my laundry from the 12th floor to the basement only to find that every machine is taken. It’s already hard for me to find time to do my laundry as it is.”

Needs:

- Accurate tracking system to know when laundry machines are available

Competitive Analysis

Columbia Housing uses LaundryView to monitor the machines, but this site **isn't well known** throughout the residence halls and **90% of interviewees have never used it.**

We noticed some LaundryView issues that LionWash can address:

1. Machine availability online doesn't match real-time activity
2. Incomplete building list: 5 residence halls aren't included
3. Confusing floor plan doesn't indicate specific machines
4. Graph showing peak times of machine usage doesn't have data

The app version only shows machine availability and excludes all of the website features. This analysis will only focus on the website.

Competitive
Analysis

Features/Functions	LaundryView	LionWash
Timer	No	Yes
Available for all dorm buildings	No	Yes
Flag to report an issue	Yes	Yes
Real-time machine progress tracking	Yes	Yes
Graph of peak times for machine usage	Yes	No

LionWash does not show peak times of machine usage because:

1. Schedules may vary, but classes and dining halls have set times and club meetings are held at night. Students free during periods of activity know that laundry rooms will be relatively empty.
2. The interviews confirmed that most students are busy and unlikely to schedule their days around the best time to do laundry because it's not their top priority.

Key Features

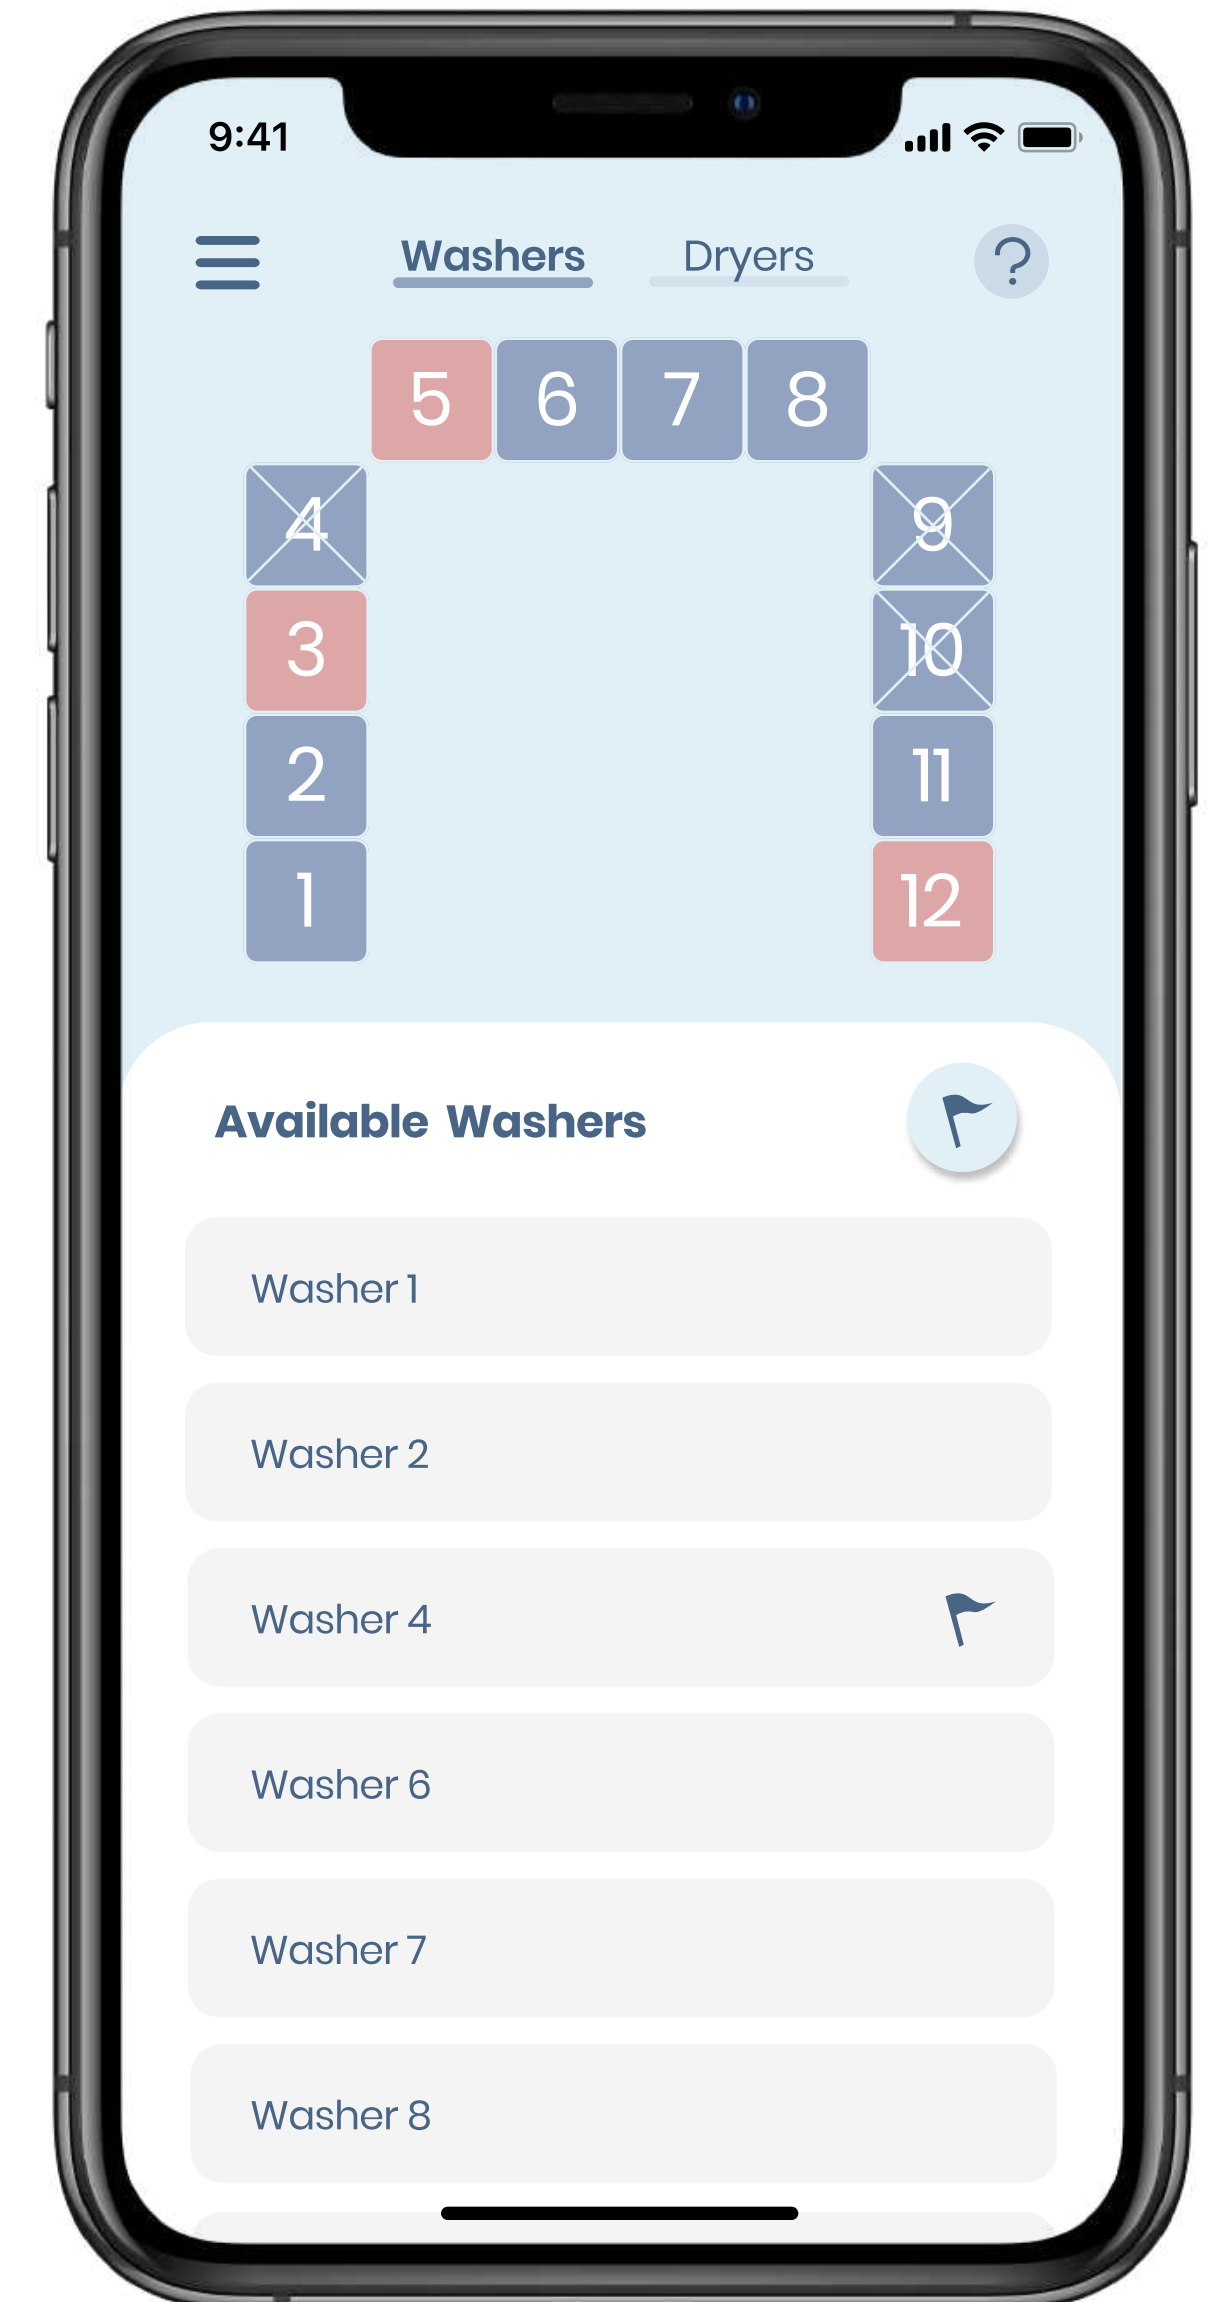

Real-time tracking

To make this as easy to use as possible, we:

1. Simplified and color-coded layout to indicate machine activity
2. Divided “Washers” and “Dryers”
3. Numbered tiles to match machine labels

- Available
- Flagged or Broken
- In Use

Key Features

Built-in timer

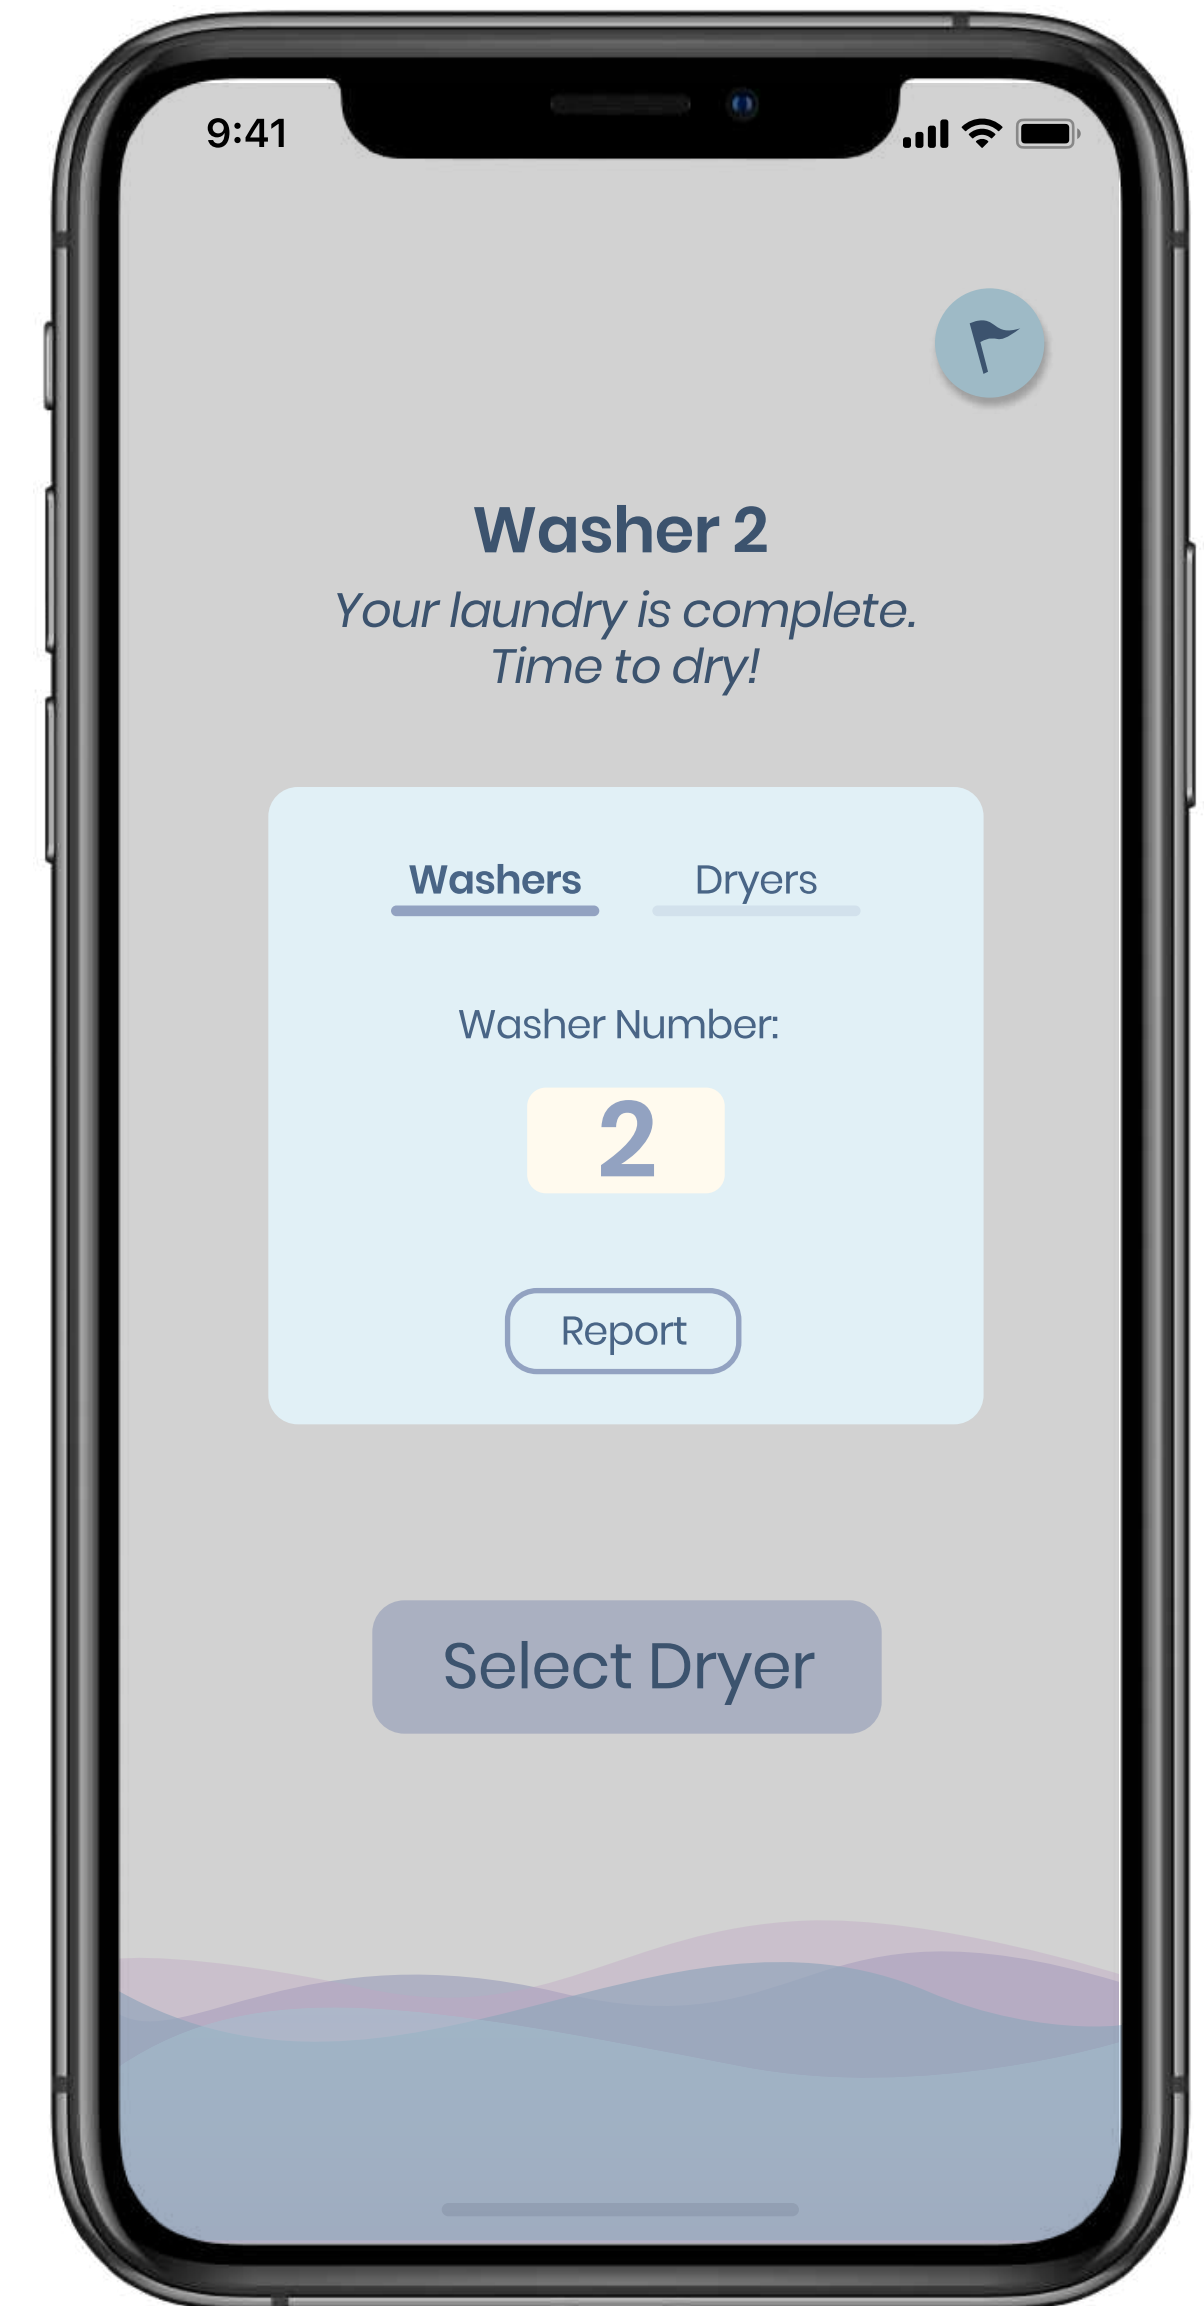

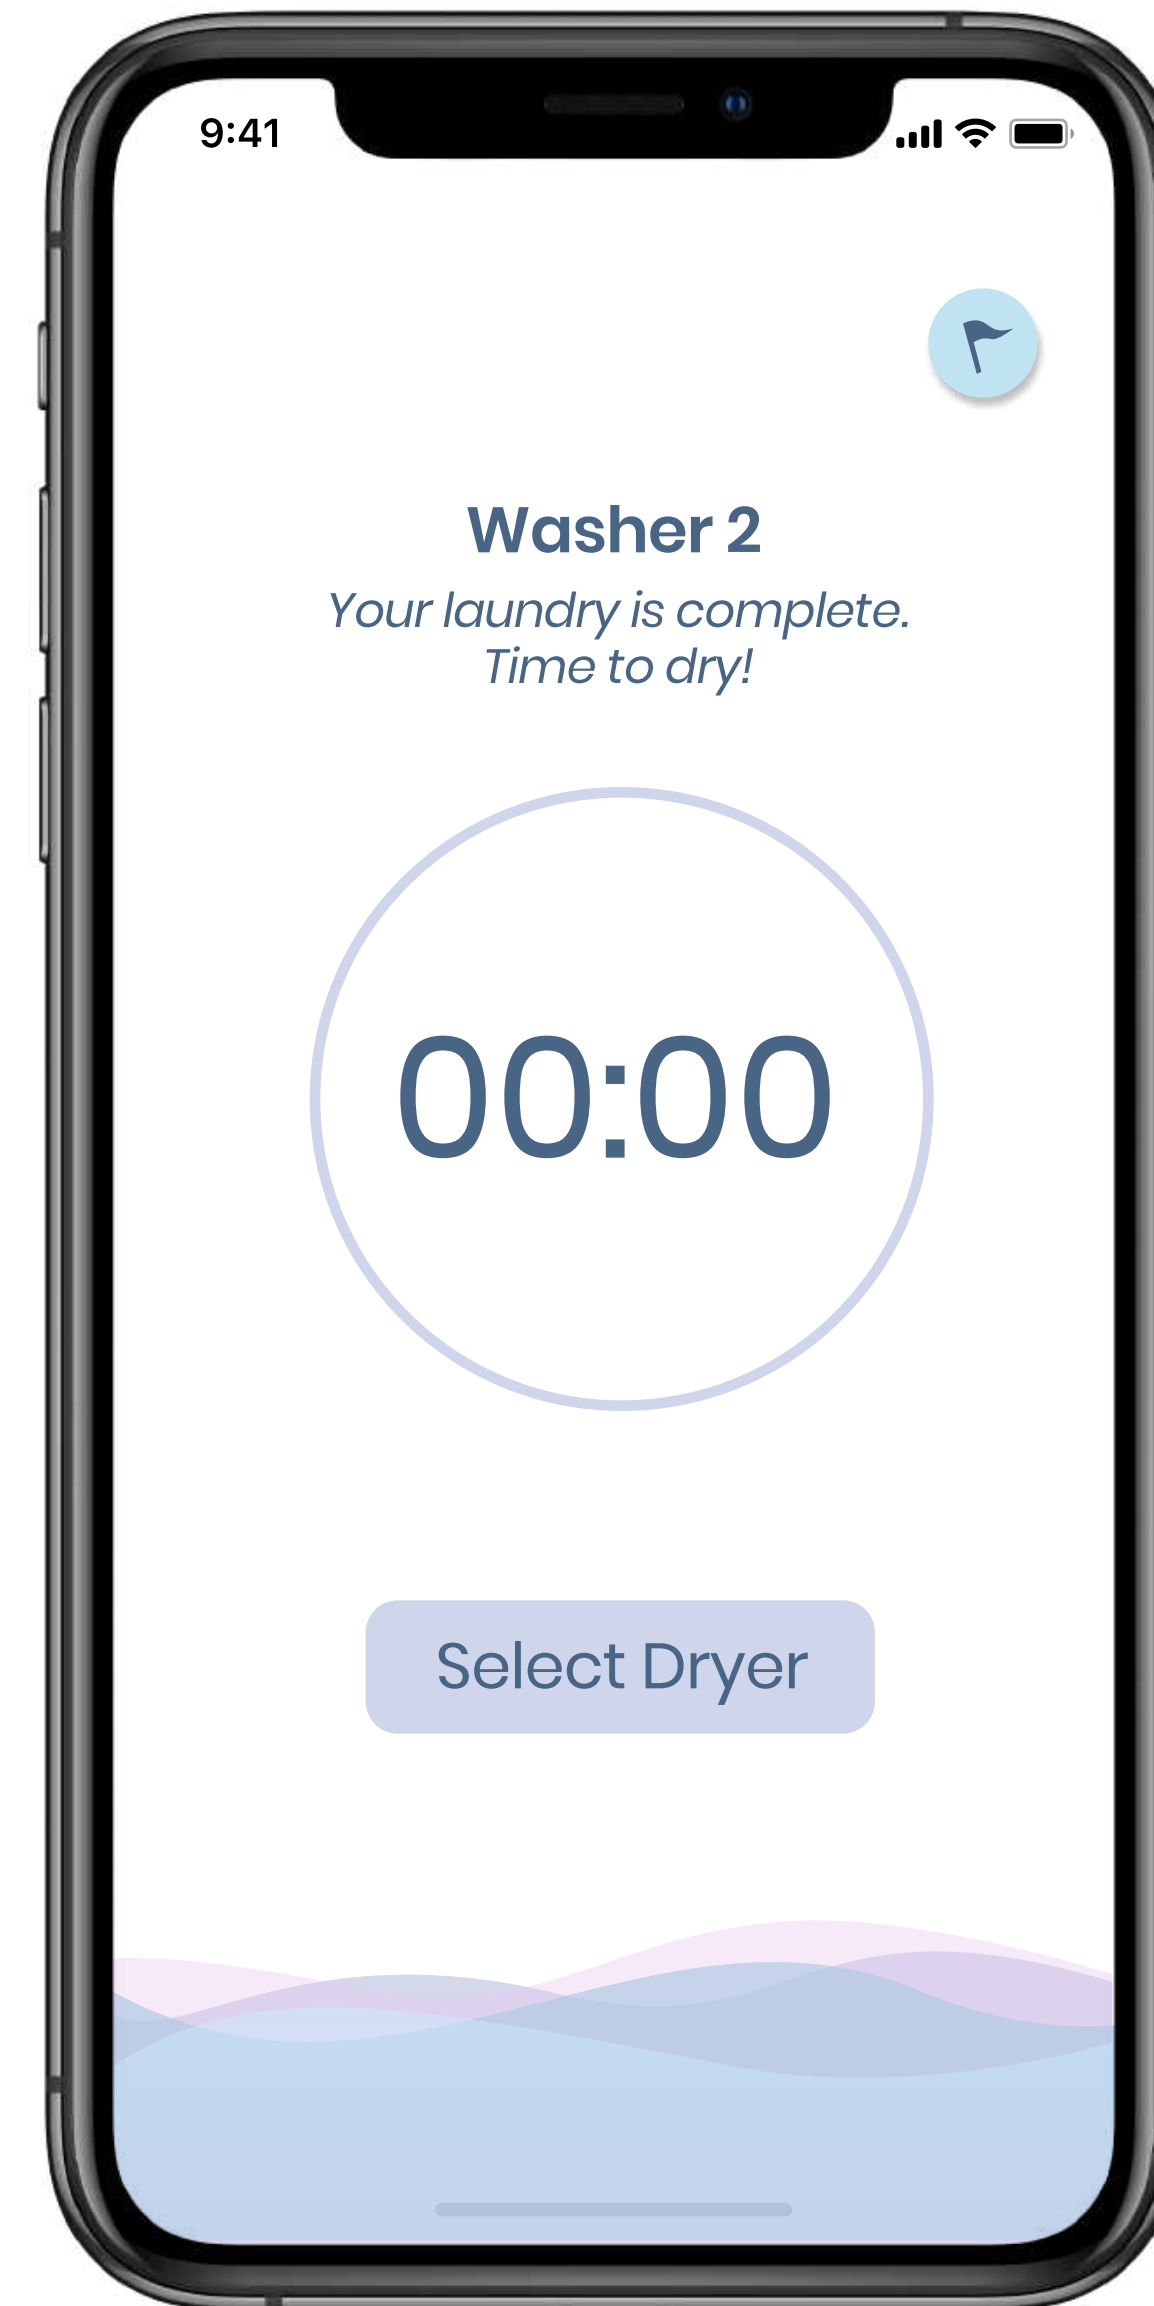

After selecting a machine, the student will be directed to the timer. It is already set at the standard lengths of time for both washing and drying cycles, but can be adjusted by dragging the circle.

Key Features

Flag Button

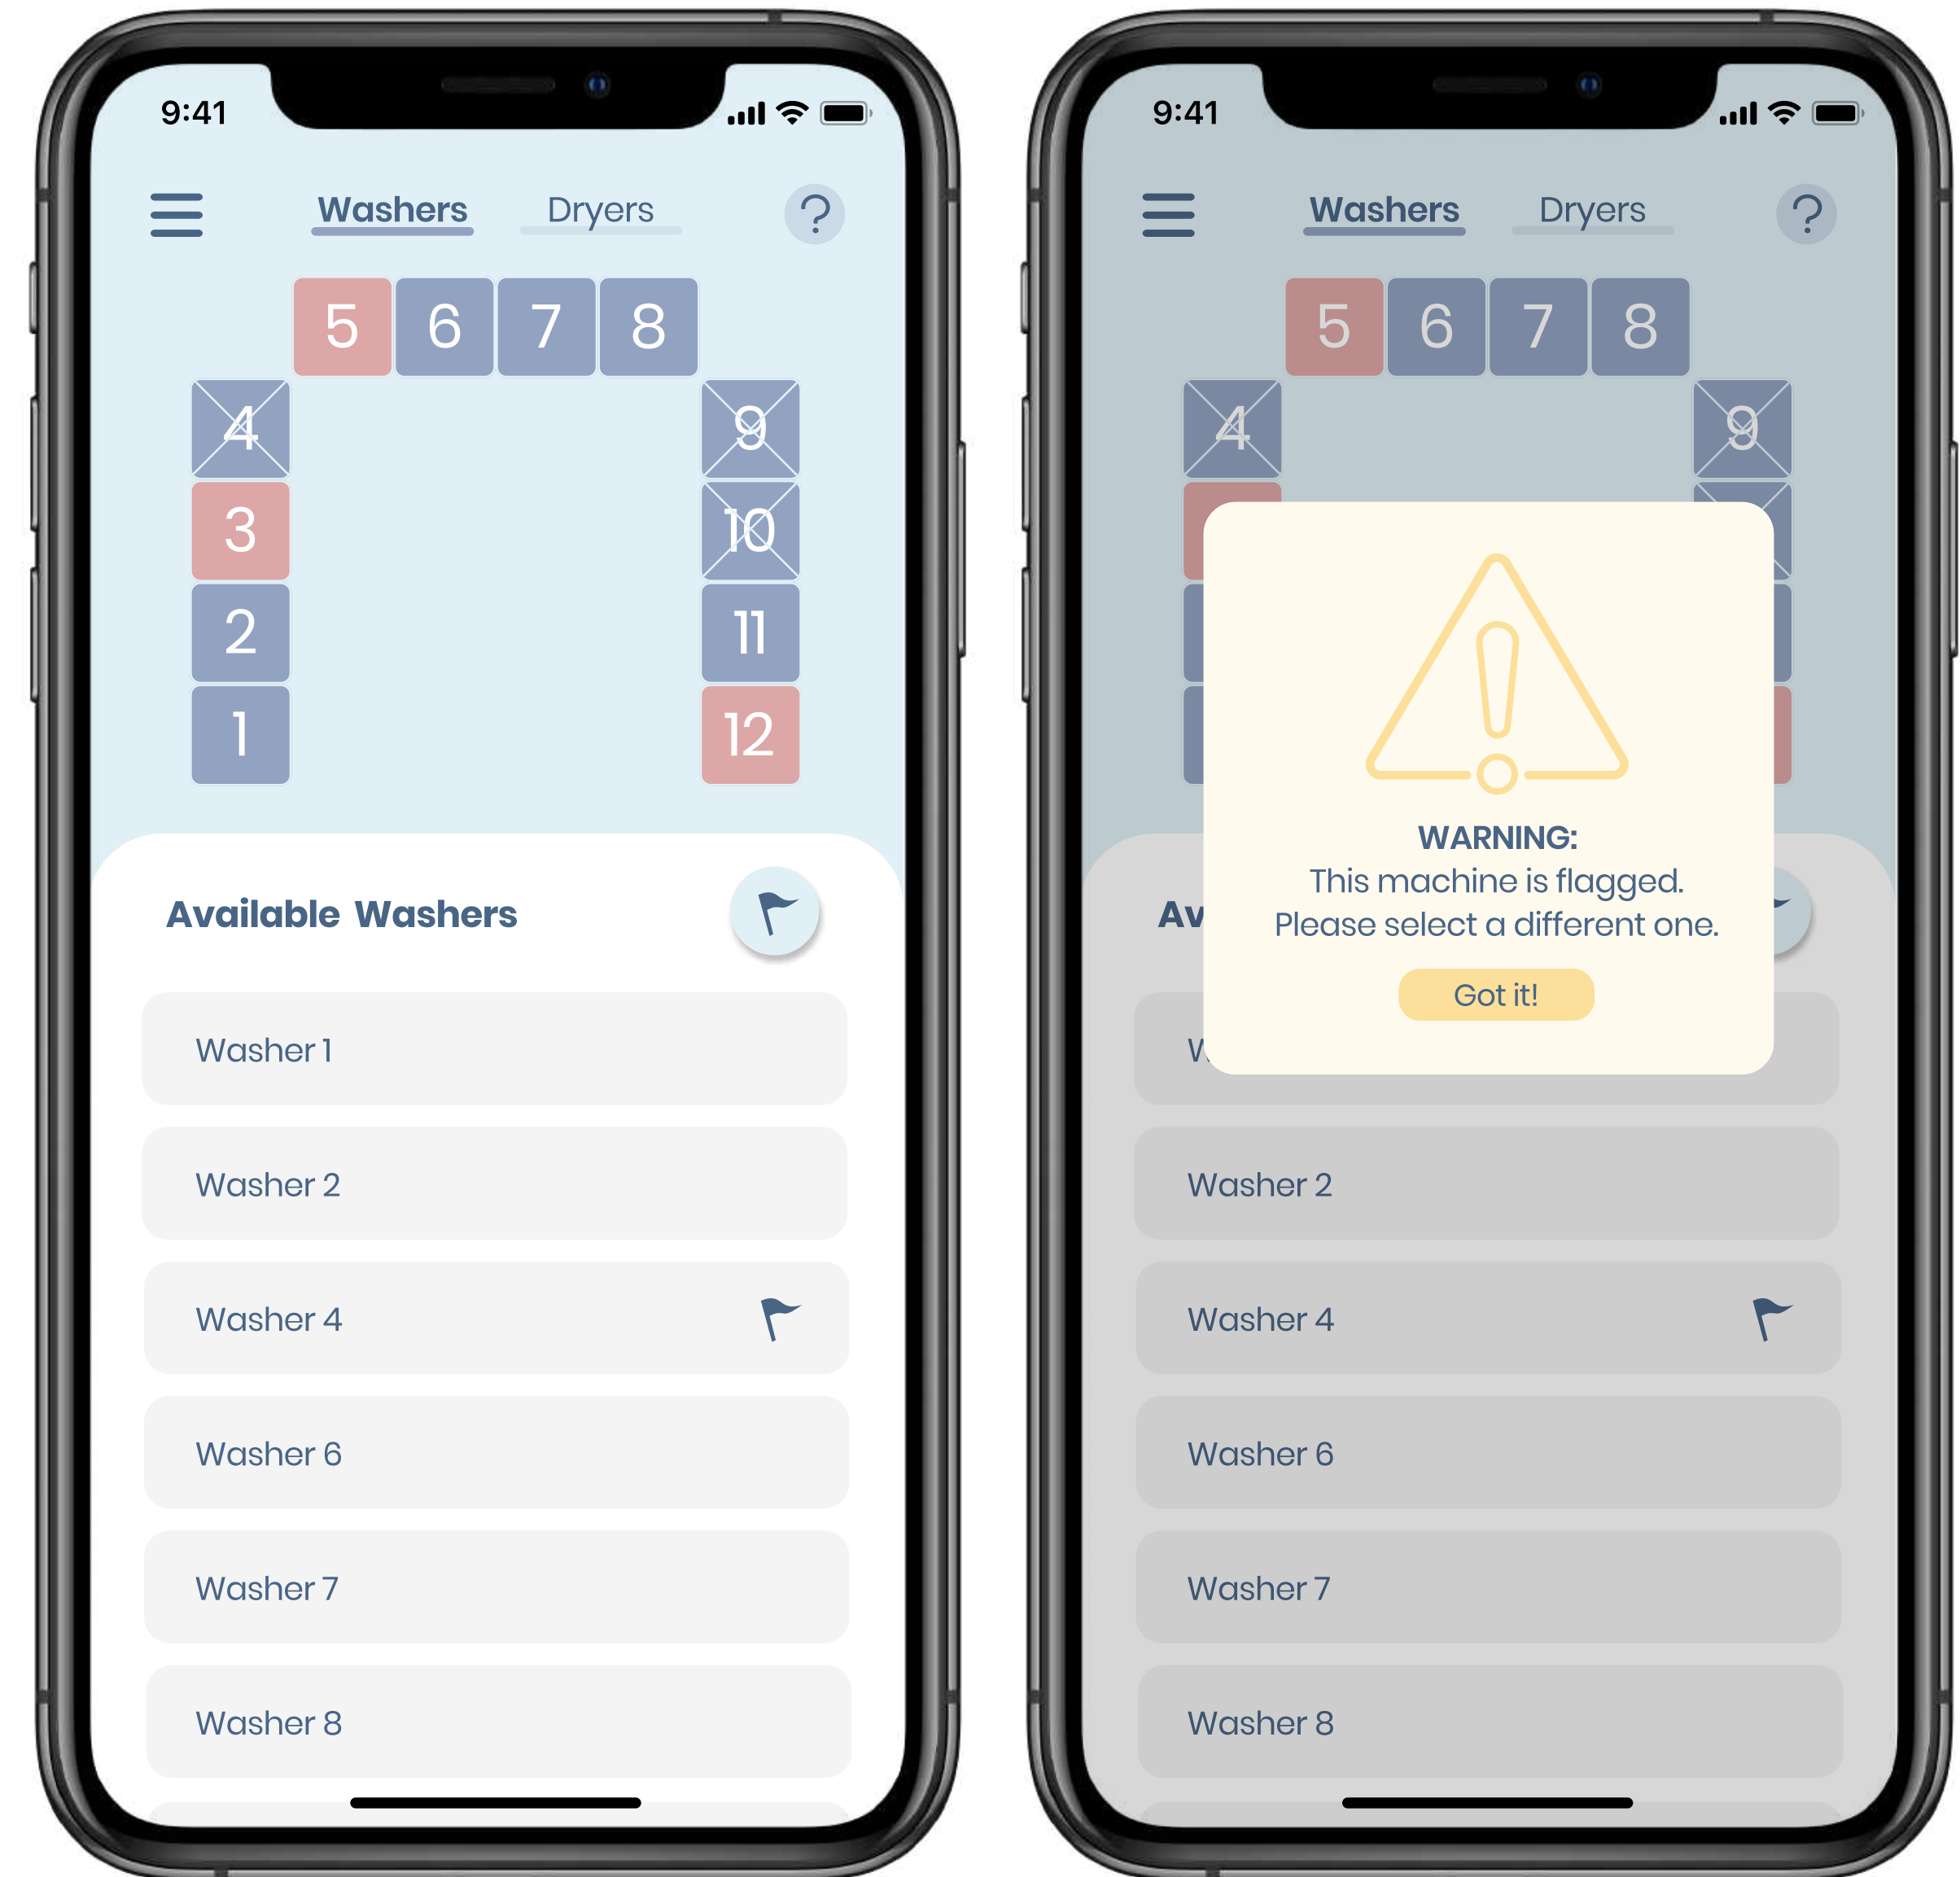

If students experience issues with a machine, they can press on the flag button to report the problem, which will notify other users to avoid the machine.

Key Features

Flag Icon

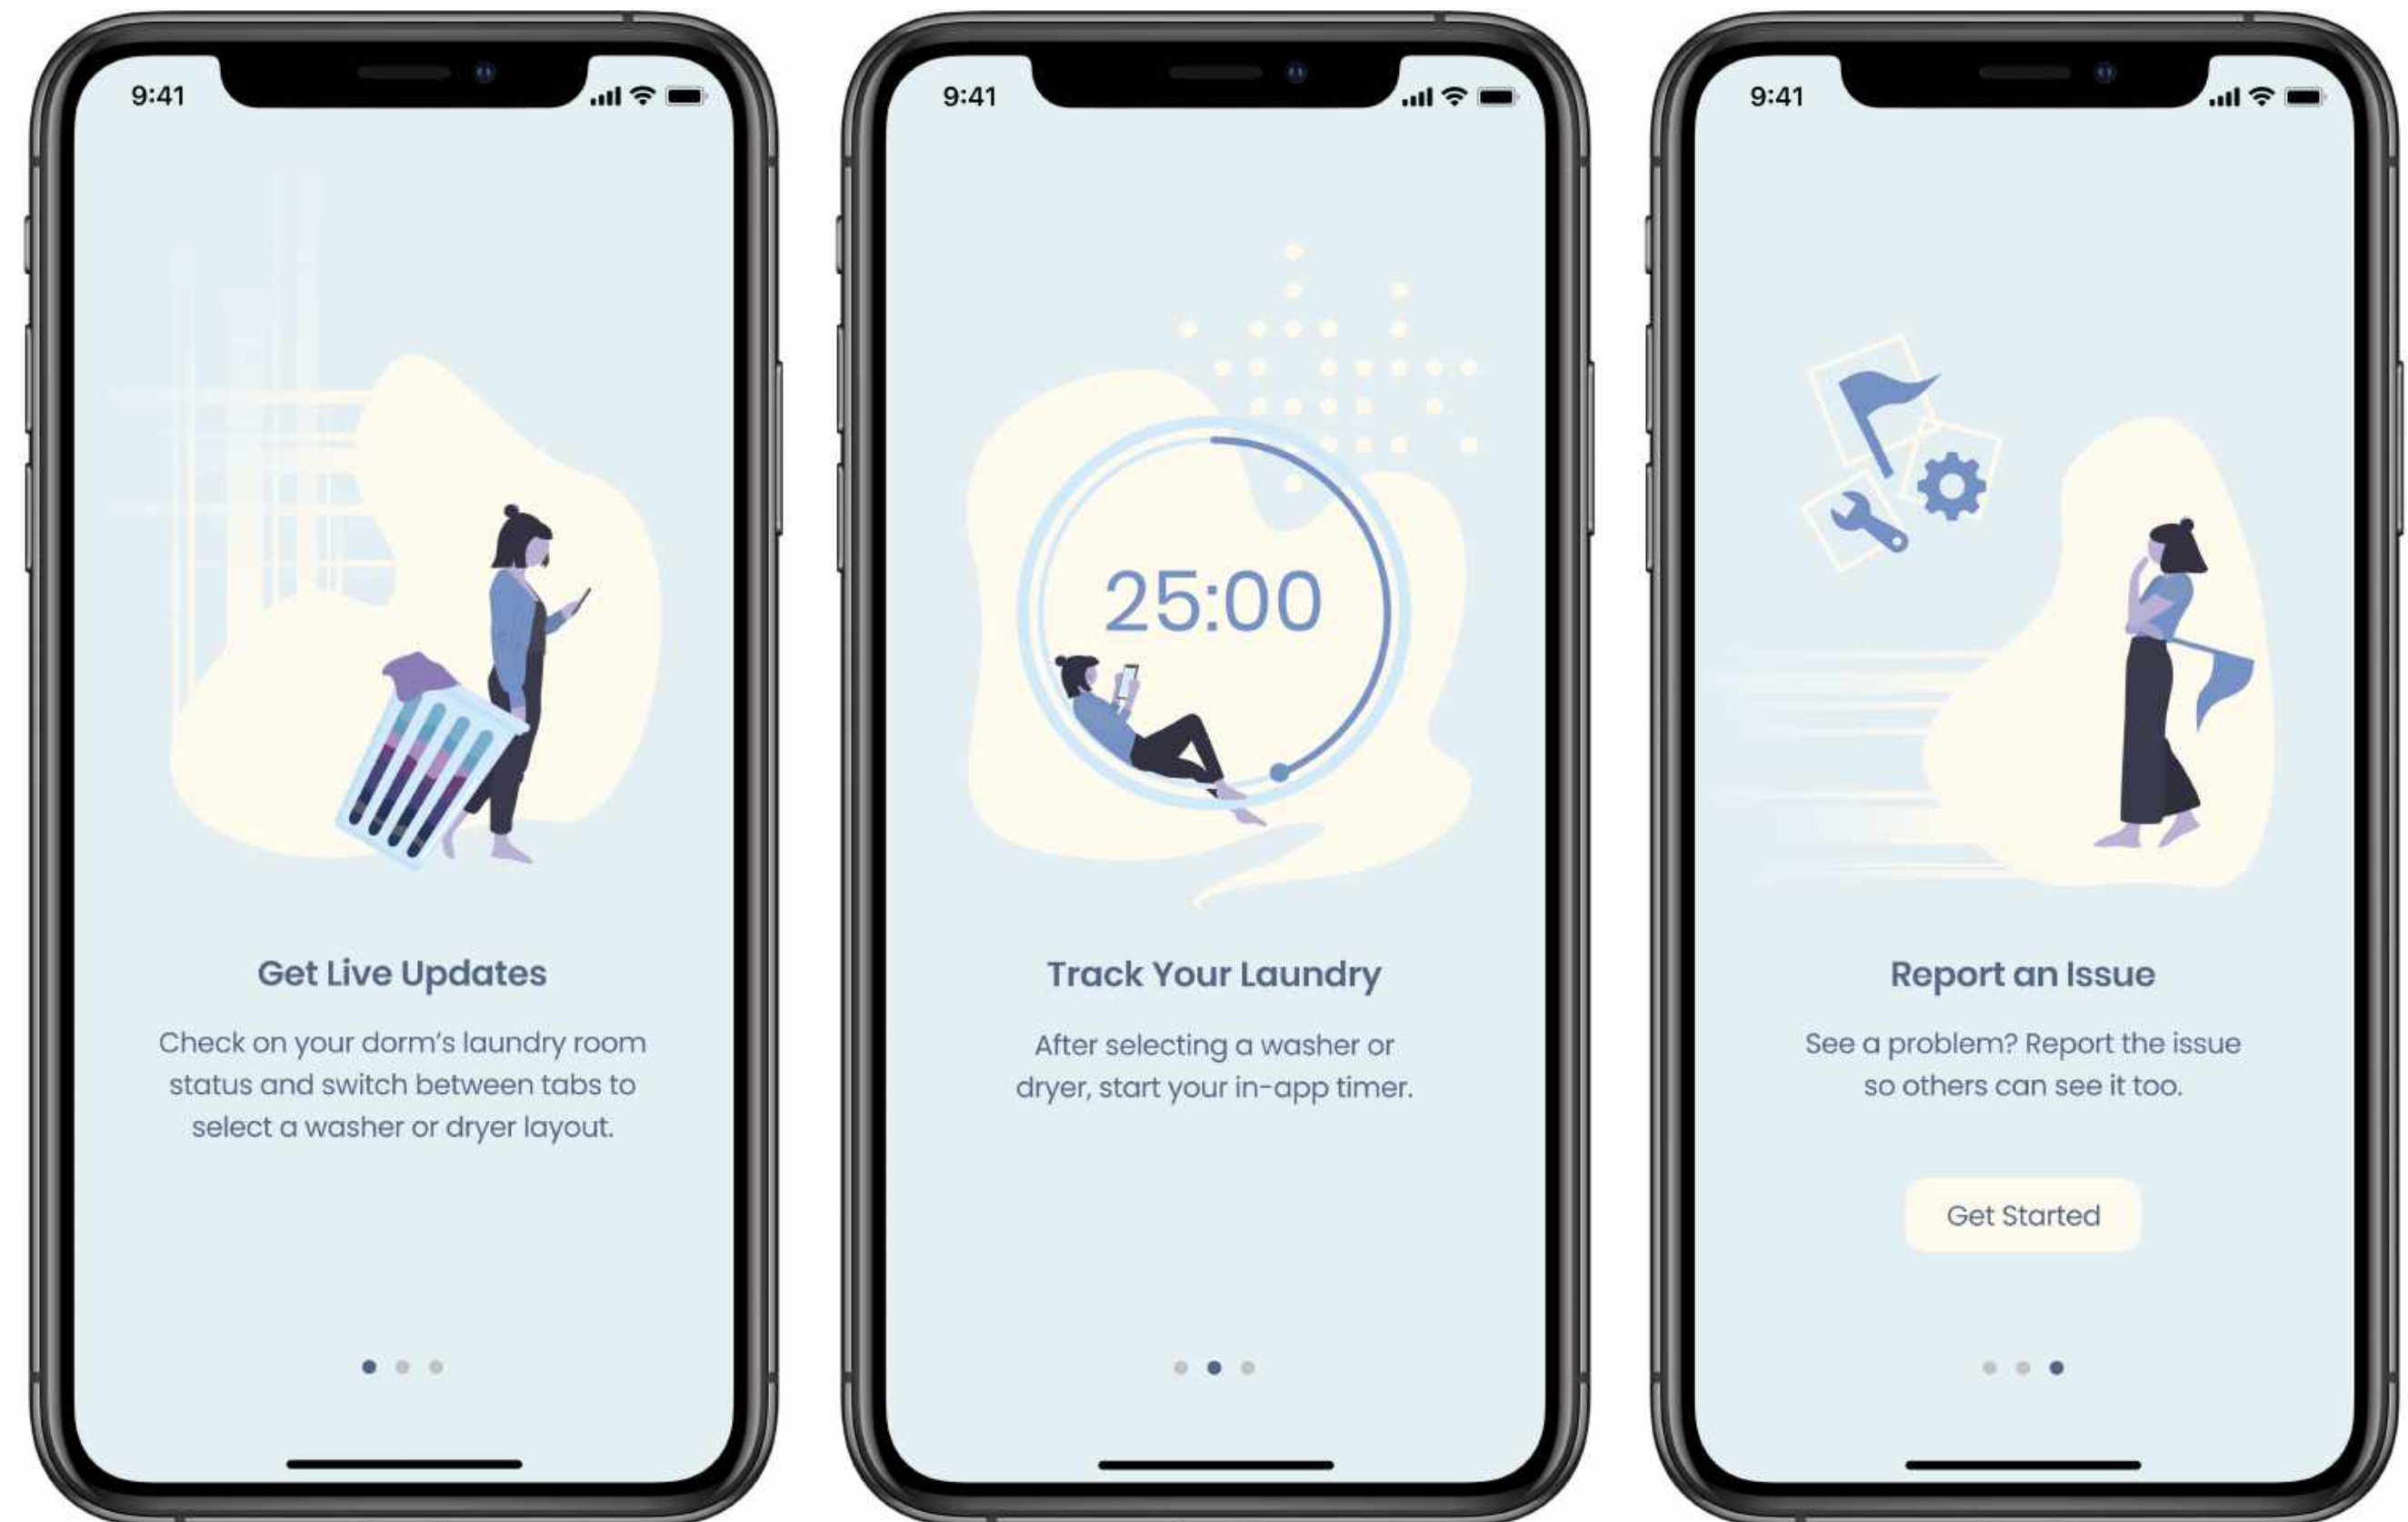

After tapping on a machine with the flag icon, a warning will pop up to indicate that the machine has been flagged. It is still classified on the list as available because the internal laundry system that connects to this app can only track machine activity.

User Journey

Onboarding

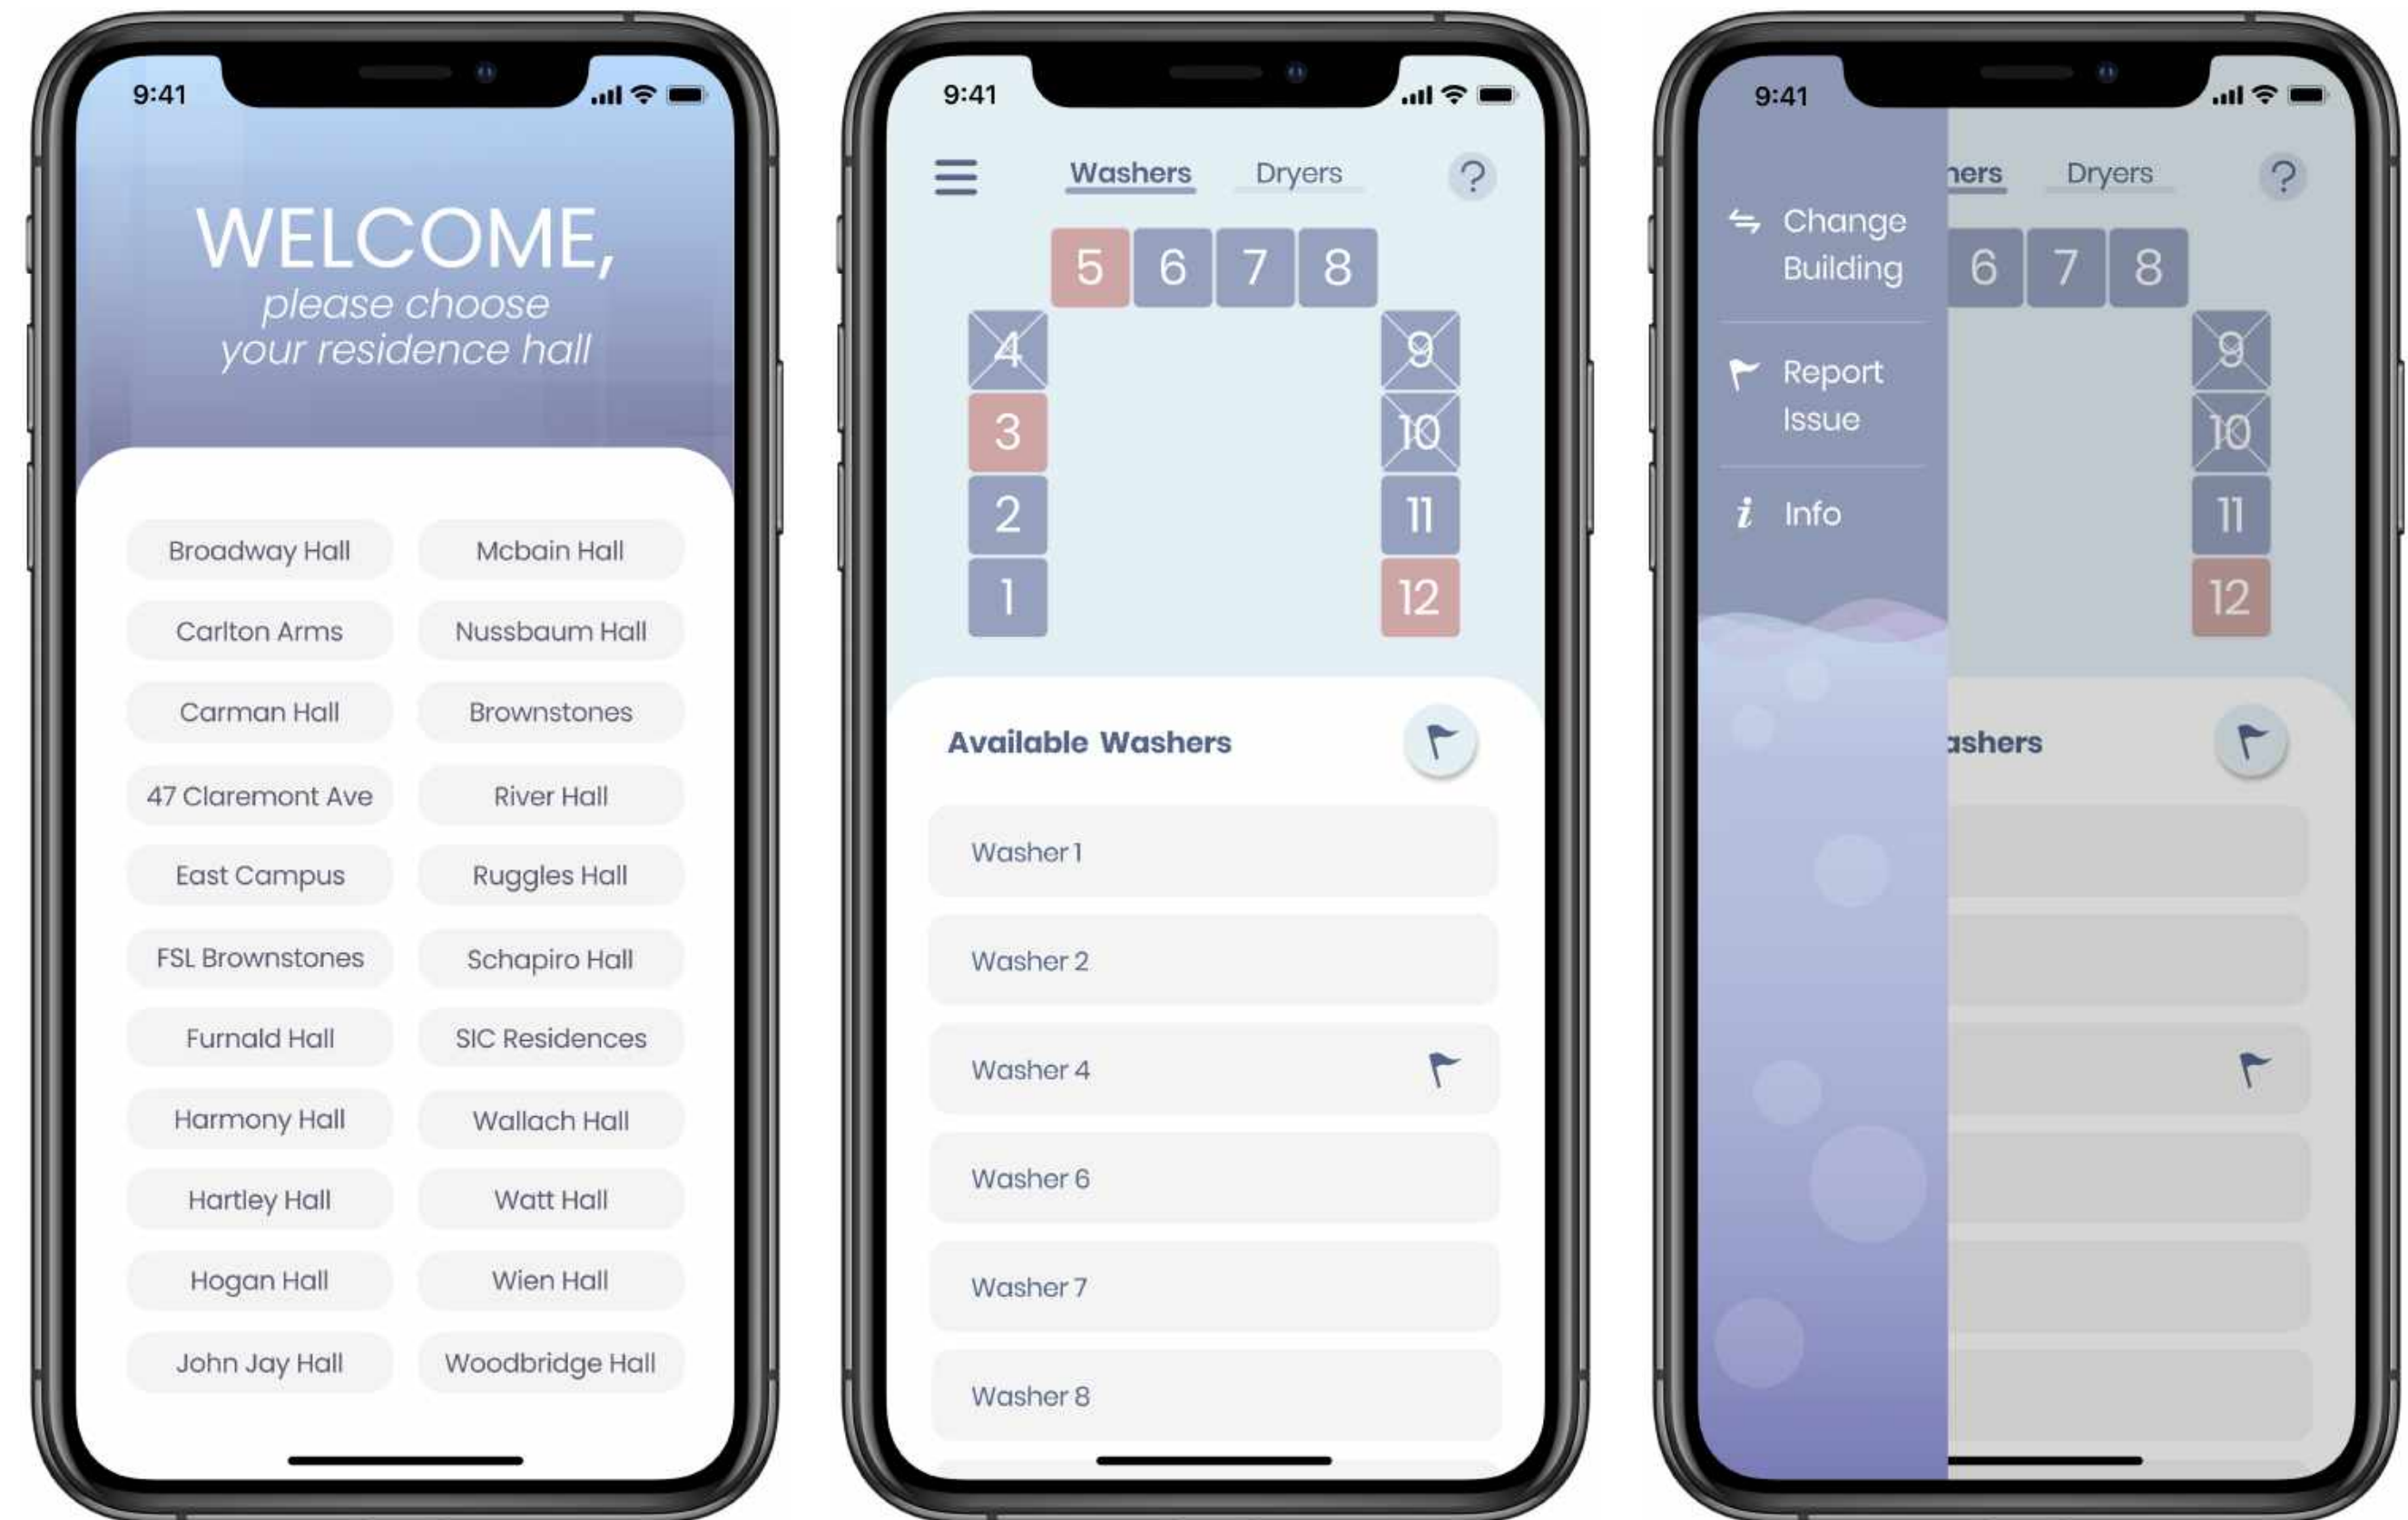

After downloading the app, students are directed to the onboarding process, which shows a quick overview of the app's capabilities.

User Journey

Building Selection

After onboarding, students will choose their dorm buildings, which then takes them to the washer layout. The menu icon allows them to change buildings and look through the onboarding screens again.

User Journey

Washer Selection and Timer

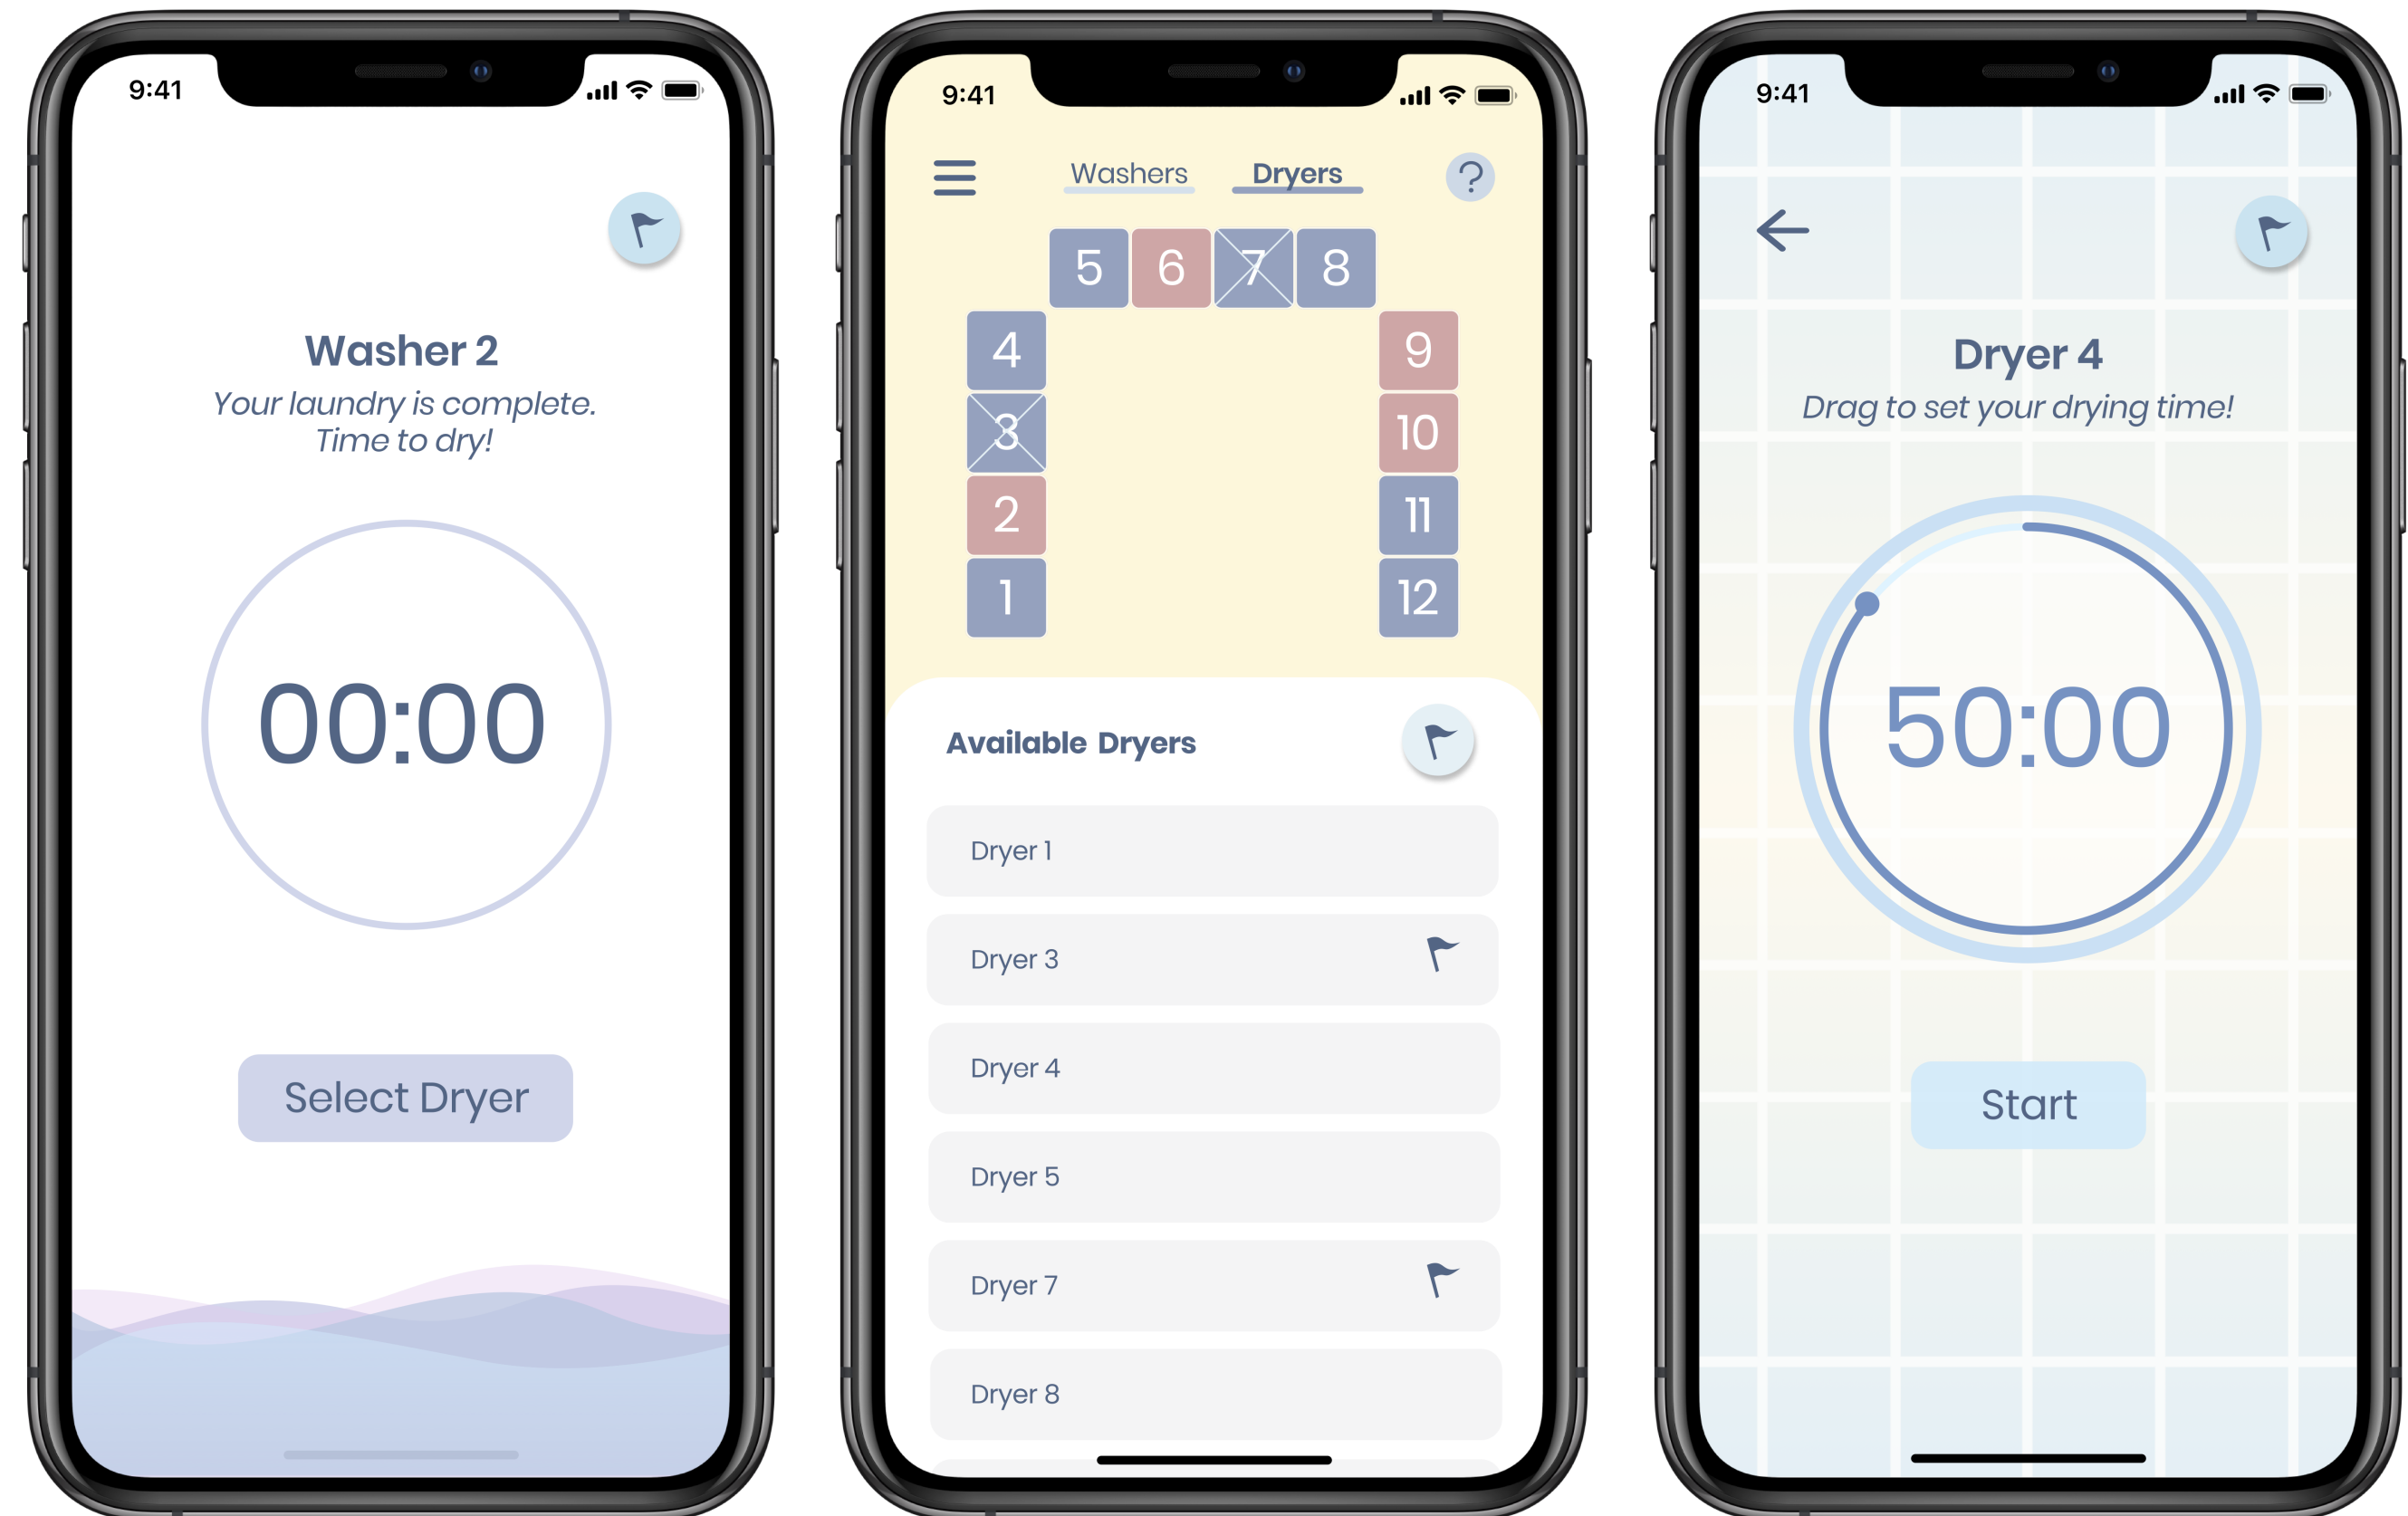

After selecting an available washer, students will be directed to set the timer.

User Journey

Dryer Selection and Timer

After the water level has fallen completely and laundry is finished, the timer will direct students to the dryer layout to begin the same process.

Style Guide

Because LionWash is unique to Columbia, the overall color scheme was created with university branding in mind. Thus, the majority of the app is made up of different shades of blue, which is also associated with water and conveniently matches the laundry concept.

Design Decisions

Washer/Dryer Layout

The different background colors were chosen to show distinction between which tab the user selected. The washer background is blue, a cool color representing water. In contrast, the dryer background is yellow because it's a warm color, giving off the idea of heat.

Color Choices and Functions

Many of the interviewees spoke about how the laundry process was more irritating for them when they were stressed and busy. In response, we chose pastel colors to keep the overall look light and created 3 main functions to keep it simple. Students will appreciate an app that is not only aesthetically pleasing but also easy to use.

Next Steps

Additional Features to Include

Looking back at this 2 week sprint, we thought of some features that could be added in future iterations if given more time:

1. **Messaging**: Students who come across finished laundry can contact the current user of the specific machine, resulting in less confusion and fewer piles of finished laundry left outside.
2. **Timer Settings**: Students can set the frequency of reminders based on time intervals. These notifications can be especially helpful for those who tend to forget about their laundry. The time remaining for machines in use should also be visible to everyone.

In order to improve the user experience, we would like to conduct user testing and design the interactive experience based on feedback.

Important Takeaways

Research: Understanding both the user and competition is crucial for a product design project because they influence the building blocks that make up the product. Creating a specific component after conducting research helps narrow down design options to effectively pinpoint the most optimal way it can be presented to the user.

Simple ≠ Easy: This app is meant to be simple, but what might seem easy can actually be logistically challenging. In fact, apps that are the easiest to use must go through countless rounds of information restructuring in order to create the best user experience possible.

Balance: Especially with more ideas for new features in future iterations, the complexity and variety of functions must be offset by a clean design. Creating an app that can meet the needs of its users without unnecessary complications is a problem solver's balancing act.
